

A. C. BACHMEYER, M.D.
Dean of the College of Medicine

Dr. A. C. Bachmeyer occupies rather a unique position, being Dean of the University of Cincinnati Medical College and Superintendent of the General Hospital. Neither role could be more ably performed by anyone else. He has brought success to both through his industry, character, and progressive study. Under Dr. Bachmeyer's leadership our College of Medicine has become one of the leading medical colleges of the United States.

A recent addition to the college is the Charles Franklin Kettering laboratory of Applied Physiology, built for the purpose of investigating the evil effects which arise from modern inventions and unknown commodities appearing every day on the market. The realization of the need for such investigation brought the Physiology department into this work in 1924. It concerned itself especially with the health dangers which arise from the manufacture and distribution of Ethyl gasoline. An important result of the work is the recognition of the danger of exposing the public to certain lead compounds. The discovery interested various industrial groups which combined with the department to further the study. Finding their headquarters inadequate and crowded, they built this new laboratory. Although it has been constructed for the principle purpose of studying lead compounds, work relating to the behavior of certain refrigerants will be carried on here. Each study will be thorough and exhaustive, making it impossible to deal with a large number of subjects.
